PROFESSIONAL SUMMARY

Full-Stack Developer with 1+ year of hands-on experience building and shipping production web applications using React.js and Node.js. Experienced across the end-to-end development lifecycle, including REST API design, database schema modelling, responsive UI development, and maintaining stable production systems. Proactively identify and resolve performance bottlenecks, with a focus on improving system reliability and efficiency. Secondary proficiency in Python and data tooling, applied to support data-driven engineering decisions.

SKILLS

Frontend	React.js, JavaScript, Vite
Backend	Node.js, Express.js, REST APIs, JWT Authentication
Database	MySQL, MSSQL
Programming	Python

WORK EXPERIENCE

Full Stack Developer - ExpNovateur	September 2024 - Present
- Built and maintained multiple web applications using React.js and Node.js, ensuring reliable performance across deployments. - Identified two high-traffic Express.js routes returning responses in 380–450ms; profiled the query execution plans, added composite indexes on join columns, and restructured the queries — bringing average response time to 160ms. - Designed and integrated REST API endpoints in Express.js with request validation middleware and stateless JWT authentication, reducing invalid requests reaching the database and improving API reliability. - Performed cross-browser testing across Chrome, Safari, and Edge before releases, identifying and resolving rendering issues to ensure a consistent user experience.	

PROJECTS

Full-Stack E-Commerce Platform (Customer+Admin)	React, Vite, Node.js, Express.js, MSSQL, JWT
- Designed a normalised MSSQL schema covering products, users, orders, addresses, and discount codes, then built two independently-routed portals — a customer storefront and an admin dashboard — from schema design to deployment. - Implemented JWT authentication with server-side refresh token rotation: on every token refresh the prior token is invalidated immediately, eliminating session fixation without forcing users to re-authenticate. - Engineered the entire order lifecycle inside a single database transaction — cart persistence, multi-address check-out, real-time discount code validation, order status updates, and cancellation with inventory rollback — so no partial order state can persist if any step fails. - Integrated three external services: a shipment-tracking API for live delivery status, WhatsApp Business API for automated order notifications, and SMTP for transactional emails. - Built role-based access control (RBAC) enforced at both the route and middleware level on the admin panel, with separate permission scopes for product management, order management, user management, and discount administration — preventing any cross-role data access.	

Flipkart Product Scraper

Python, BeautifulSoup, Requests, Streamlit, Pandas

- Built a scraper pipeline that collects 1,000+ product records (name, price, ratings, category) in under 30 seconds; identified the bottleneck as sequential HTTP requests and replaced them with a concurrent fetch pattern.
- Wrapped the pipeline in a Streamlit interface with single-click execution, configurable category filters, and a live progress indicator — enabling non-technical stakeholders to self-serve data exports without any engineering involvement.
- Applied Pandas deduplication, schema normalisation, and category aggregation to raw scraped data, producing structured CSVs that enabled efficient competitive price-trend analysis and reduced manual data preparation efforts.

EDUCATION

B.tech in Computer Science (Data Science and Artificial Intelligence) Shri Ramswaroop Memorial University, Lucknow.	2020 - 2024
Class XII Jeevandeep Public School	2018 - 2019

CERTIFICATES

Python for Data Science	IBM
Getting Started with DevOps on AWS	AWS
Data Visualization with Python	IBM
Machine Learning with Python Level-1	IBM
